

WHAT IS CLAIMED IS:

Sub A 7 1. A method for data processing comprising:
receiving a data request at a data center;
assigning a priority to the request;
5 queuing the request as a function of the priority
associated with the request; and
retrieving the requested data from an origin server.

2. The method for data processing according to Claim 1,
10 wherein the data center comprises a cache server, a flow
control server and a web server.

3. The method for data processing according to Claim 1
further comprising:

15 determining a load associated with the origin server;
controlling at a flow control server retrieval of data
from the origin server by a cache server;

granting permission from the flow control server to the
cache server to retrieve data when the load associated with
20 the origin server is below a threshold; and

denying permission from the flow control server to the
cache server to retrieve data when the load associated with
the origin server is above the threshold.

25 4. The method for data processing according to Claim 3,
wherein the threshold is determined as a function of the load
of the origin server.

5. The method for data processing according to Claim 1,
30 wherein assigning the priority to the request comprises
determining the priority based on a state associated with the
request.

Sub A 7 6. The method for data processing according to Claim 1 further comprising communicating alternate content to a remote computer associated with the request.

5 7. The method for data processing according to Claim 6, wherein the alternate content comprises a status page and wherein the status page is communicated when the load at the origin server exceeds a predetermined threshold.

10 8. The method for data processing according to Claim 6, wherein communicating the alternate content comprises:
associating a queue delay time with the request;
determining whether the queue delay time exceeds a threshold;

15 generating the alternate content as a function of predetermined criteria associated with the origin server when the queue delay time exceeds the threshold; and
returning the alternate content to the remote computer.

20 9. The method for data processing according to Claim 8, wherein the data requested is generated at a client computer remote from the data center and wherein generating the alternate content comprises selecting the alternate content as a function of the bandwidth available to the client computer.

25 10. The method for data processing according to Claim 9, wherein generating the alternate content further comprises determining the amount of bandwidth available to the client computer, wherein the amount of bandwidth comprises one of
30 high-bandwidth, medium-bandwidth and low-bandwidth.

sub A 7

11. The method for data processing according to Claim 8, wherein generating the alternate content further comprises generating the alternate content based on the queue delay time and the predetermined criteria.

5

12. The method for data processing according to Claim 8, wherein the predetermined criteria comprises information associated with the request.

10

13. The method for data processing according to Claim 8, wherein the predetermined criteria comprises external information associated with a user associated with the request.

15

14. The method for data processing according to Claim 13, wherein the external information comprises historical shopping information associated with the user associated with the request.

20

15. The method for data processing according to Claim 6, wherein the alternate content comprises a status page and further including resubmitting the data request to the data center by a browser to update the status page.

25

16. The method for data processing according to Claim 15, wherein resubmitting the data request is performed automatically by the browser.

Sub A' 7

17. The method for data processing according to Claim 1, wherein assigning the priority to the request comprises determining whether the request is prioritizable, and wherein the priority is a first priority when the request is non-prioritizable and wherein the priority is a second priority when the request is prioritizable.

18. The method for data processing according to Claim 17, wherein the first priority is a default priority and wherein the second priority is determined as a function of the data requested by the data request.

19. The method for data processing according to Claim 1 further comprising determining the load on an origin server by comparing a load metric associated with the origin server to a predetermined threshold.

20. The method for data processing according to Claim 19, wherein the load metric comprises the number of requests being handled by the origin server.

21. The method for data processing according to Claim 19, wherein the load metric comprises the number of network connections being supported by the origin server.

22. The method for data processing according to Claim 19, wherein the load metric comprises the delay associated with retrieving a predetermined web page from the origin server.

Sub A'7

23. The method for data processing according to Claim 1, wherein the request is a first request and wherein queuing the request comprises:

storing the first request in a queue associated with the
5 data center, the queue having therein a plurality of second requests distinct from the first request, each of the second requests having a respective priority associated therewith;

sorting the queue as a function of the respective
priority associated with the first request and each of the
10 second requests; and

wherein retrieving the requested data comprises:

processing the highest priority request in the queue by
the origin server.

24. The method for data processing according to Claim 1, wherein the data center comprises a plurality of data centers and wherein receiving the request comprises:

determining a network distance between a client computer
and at least one of the data centers;

20 determining the closest data center to the client computer;

resolving a destination address associated with the
request to the closest data center; and

routing the request to the closest data center.

000000-5246550

Sub A 7
25. A system for dynamic flow control comprising:
a cache server operable to receive a request for content
and retrieve content from an origin server in response
thereto; and

5 a flow control server having an associated queue and
coupled to the cache server, the flow control server operable
to:

assign a priority to the request;
store the prioritized request in the queue as a
10 function of the priority associated with the request; and
regulate the retrieval of content from the origin
server by the cache server.

26. The system for dynamic flow control according to
15 Claim 25, wherein the cache server is further operable to
request permission from the flow control server to retrieve
content from the origin server.

27. The system for dynamic flow control according to
20 Claim 25, wherein the flow control server is further operable
to associate a priority with the request based on the content
requested by the request and determine a processing load
associated with the origin server.

28. The system for dynamic flow control according to
25 Claim 25, wherein the flow control server is further operable
to associated a priority with the request based on external
information associated with the request.

29. The system for dynamic flow control according to Claim 28, wherein the external information comprises historical information associated with a user associated with the request.

[illegible]

Sub A' 7

30. A method for dynamic flow control comprising:
receiving a data request at a flow control server;
associating a priority with the data request;
storing the data request in a queue as a function of the
5 priority associated with the data request; and
retrieving data requested by the data request from a
protected resource.

31. The method for dynamic flow control according to
10 Claim 30 further comprising determining a load at the
protected resource, and wherein associating a priority with
the data request comprises associating the priority with the
data request when the load at the protected resource exceeds a
predetermined threshold and wherein queuing the data request
15 comprises queuing the data request when the load at the
protected resource exceeds the predetermined threshold.

32. The method for dynamic flow control according to
Claim 31 further comprising indicating status information to
20 be returned to a remote computer associated with the data
request.

33. The method for dynamic flow control according to
Claim 31 further comprising indicating alternate content to be
25 returned to a remote computer associated with the data
request.

34. The method for dynamic flow control according to
Claim 33 further comprising determining the alternate content
30 as a function of the bandwidth associated with the remote
computer.

Sub A'7

35. The method for dynamic flow control according to Claim 32, wherein the status information comprises a status web page and wherein indicating status information comprises selecting the status page based on priority criteria
5 associated with the protected resource.

36. The method for dynamic flow control according to Claim 35 further comprising resubmitting the data request after a predetermined time interval to the flow control
10 server.

37. The method for dynamic flow control according to Claim 36, wherein resubmitting the data request is performed automatically.
15

38. The method for dynamic flow control according to Claim 35 further comprising delaying communication of the status page indication for a predetermined time interval based on the priority criteria.
20

39. The method for dynamic flow control according to Claim 38, wherein delaying communication of the status page comprises delaying communication of the status page indication based on an expected delay associated with the protected
25 resource.

40. The method for dynamic flow control according to Claim 31, wherein receiving the data request comprises receiving the data request from a flow controlled device.
30

Sub A 7 41. The method for dynamic flow control according to
Claim 31, wherein retrieving the data requested by the data
request comprises:

5 removing at least one prioritized data request from the
queue when the load at the protected resource is below the
predetermined threshold;

communicating the prioritized data requests to the
protected resource;

10 retrieving the requested data from the protected
resource; and

communicating the requested data to a flow controlled
device associated with the data request.

15 42. The method for dynamic flow control according to
Claim 41, wherein removing at least one prioritized data
request comprises removing the highest priority data request.

20 43. The method for dynamic flow control according to
Claim 41, wherein associating the priority with the request
comprises determining whether the request is prioritizable,
and wherein the priority is a first priority when the request
is non-prioritizable and wherein the priority is a second
priority when the request is prioritizable.

25 44. The method for data processing according to Claim
43, wherein the first priority is a default priority and
wherein the second priority is determined as a function of the
request.

Sub A' 7

45. A method for content filtering comprising:
receiving a data request at a flow control server from a
flow controlled device, the data request having associated
requested data;

5 evaluating the requested data against criteria;
discarding the data request when the requested data is
forbidden by the criteria;

determining alternate data based on the criteria and the
requested data when the requested data is forbidden by the
10 criteria; and

indicating the alternate data to the flow controlled
device when the requested data is forbidden.

46. The method of content filtering according to Claim
15 45, wherein the criteria comprises the geographic origin of
the data request.

47. The method of content filtering according to Claim
45, wherein the criteria comprises the content of the
20 requested data.

48. The method of content filtering according to Claim
45, wherein the criteria comprises the geographic origin of
the data request and the content of the requested data.

25 49. The method of content filtering according to Claim
45, wherein the alternate data comprises a content forbidden
web page.

30 50. The method of content filtering according to Claim
45, wherein the alternate data comprises an allowable web
page.

Sub A' 7

51. The method of content filtering according to Claim 45, wherein indicating the alternate data comprises returning the alternate data to the flow controlled device.

5 52. The method of content filtering according to Claim 45, wherein indicating the alternate data comprises returning a location of the alternate data to the flow controlled device.
